

INTEGRATION SOLUTIONS FOR
SAP® APPLICATIONS

Flexible.
Tailored.
Reliable.

NETWORK-WIDE INTEGRATION OF YOUR SAP® APPLICATIONS FOR THE CONSISTENCY OF YOUR DATA

The Challenge

Network-wide data exchange between SAP® and Genius Project

Accurate financial and resource information is critical to business success. However, the consolidation and harmonization of budget, cost and resource data remains a challenge for organizations.

The smooth flow of data between SAP® solutions and the project management system is essential to consolidate and harmonize data, standardize processes and optimize supply chains. Complex environments and compliance processes require high level expertise, years of experience and flexible solutions.

The Solution

A smooth flow of costs from SAP® to Genius Project

With Genius Project's integration solution for SAP®, important data, such as internal or external order numbers, project titles, system status, and costs are imported into Genius Project via the SAP® interface. To ensure data consistency, only valid information is transferred and existing data is automatically updated during a new import.

Key Facts

Systems:

SAP® & Genius Project

The Challenge:

Network-wide data exchange between SAP® applications and Genius Project for the consistency of financial and resource data.

„All IT feedback are made in Genius Project and are posted to SAP® via the interface. With Genius Project, we have succeeded in making IT transparent and controlling the resources and services.“

CHRISTIAN WEIL
HEAD OF ITSM-1 SERVICE SUPPORT BUSINESS APPLICATIONS
SCHOTT AG

In Genius Project's forms, such as project descriptions, tasks, phases, or costs, it is possible to select an order number, cost center or the information to be used for the project.

The cost import takes place in the desired regular rotation and also synchronizes existing forms. The cost form includes all the fields stored in SAP®.

Consolidating time tracking, work schedules and absences in SAP® and Genius Project

The flexible integration of Genius Project allows a reliable exchange of time data from SAP®. Employees simply book their times in SAP® as per usual. All data is stored on an sFTP server and is exported daily from Genius Project at the company's desired time.

Exported data are typically personnel numbers, dates, arrival and departure times or comments on days of presences and absences. These data also contain official abbreviations for comments (eg. doc for medical appointments, ho for telework or home office, etc.), and of course, they can be individually configured.

If desired, the project can be recorded via Genius Project. Time feedback is then transferred to SAP® for further use, for accounting purposes, for example.

Absences such as medical appointments or vacations will then be taken from Genius Project and transferred to SAP®.

In addition, it is possible that time recording is based on the time tracking in Genius Project and that net working times are automatically transferred from SAP®. In this case, the calculation and selection of the actual arrival and departure times per day are carried out in SAP®. The values are adjusted and do not need to be validated in Genius Project.

Key Facts

Systems:

SAP® & Genius Project

The Solution:

- A smooth flow of costs from SAP® to Genius Project
- Consolidation of time tracking, work schedules and absences in SAP® and Genius Project
- Interfaces: XML, CSV, Webservice

The Result:

Consistent data in all systems that are automatically.

„Users can enter their incidents directly in the system via the web interface, and the resources are centrally managed by Schott. There is very high transparency of the respective projects, incidents, changes and resources“

CHRISTIAN WEIL

The Result

Integrating Genius Project with SAP® allows for automatic exchange of information such as time sheets, cost documents, human resources information and even more between the two systems. Departments such as accounting can use this up-to-date information. Project managers record project information in a single system and are assured that this information is reliable. By synchronizing the data in both systems, companies get the highest transparency, accurate data and time and cost savings.
